

Plug and Play long-term data archiving solution

All the hardware, software and tapes you need to archive your data for the long-term. FUJIFILM Kangaroo is a customisable turn-key ready solution with all components pre-installed and everything in one location - on your premises.

Create a secure space between your data and cybercrime. It's actually an air-gap that reduces your vulnerability to hackers and cyber-attacks. The writing process provides a self-healing system architecture, and the tape itself offers higher data integrity than HDDs and an archival life of over 30 years. Therefore, you can relax knowing your cold data is protected for the long term.

Keep your options open. Rather than getting tied in with certain vendors, FUJIFILM Kangaroo utilises our own FUJIFILM Object Archive software. It's self-describing, and compatible with a vast number of disk and tape systems. So, when the future comes knocking, you'll be ready.

Choose sustainability. Server rooms around the world are feeling the heat. Tape based systems save energy costs, CO₂ emissions and help reduce large amounts of electronic waste, making them an eco-friendly choice for data archiving.

It's time for tape

As data volumes shoot up and energy and storage costs spiral, the case for tape has never been stronger. Make your transition a simple one with FUJIFILM Kangaroo. Get high performance, market-leading LTO-tape technology. Plus, highly compatible FUJIFILM Object Archive software, a 1PB+ storage capacity, and a compact flight case.
